AGEPAN® SYSTEM

...works harder!

AGEPAN® THD T+G – THE INSULATION SPECIALIST

General short processing instructions

STORAGE AND TRANSPORT

- Boards must be stored horizontally
- Distance of the wooden supports must not exceed 60 cm
- Edges should be protected against damage
- Individual boards have to be transported in an upright position, if possible
- When destacking, the full board thickness has to be taken
- The material has to be protected against direct humidification during storage

OUTDOOR EXPOSURE

- When using as under-roof panel, storage under natural weathering conditions is possible to a limited extent of up to eight weeks
- Moisture absorption reduces the strength of the panel and will not be fully restored even after drying
- Temporary covering with sheets may be useful here, especially if subsequent works are done after a delay
- If the boards have absorbed moisture, re-drying to the required moisture has to be ensured before finishing the component
- Possible changes in the board length have to be considered regarding the design parameters
- The counter-battens must be fastened at all events and the sealing and masking have to be rainproof and windproof
- Draining surface water can cause discolouration in sheet metal panelling, therefore use suitable protective films and only remove them after the roof has been completely covered

ACCLIMATIZATION

- Basically, acclimatization of the material to the expectable required moisture is necessary. For this purpose, the packaging foil will be removed during storage at the place of installation
- If necessary, the changes in lengths have to be considered regarding the design parameters

DISPOSAL

- Thermal disposal must be restricted in accordance with small heating plants (1.BImSchV)
- Assignment to waste codes 030105, 150103, 170201 (EWC-codes) according to annex 3 of Waste Wood Ordinance

WALK-ON STABILITY

- Pursuant to the regulations of the german ZVDH (Central Association of German Roofers), under roofs from wood fibres are generally regarded as components not safe to walk on. Load transfer in the area between rafters is therefore not permitted. AGEPAN® THD T+G is safe to tread on in the rafter area. Accident prevention regulations must be observed

INSTALLATION INSTRUCTIONS

- Distinguish between inside and outside (outside stamping)
- Tongue points up the ridge/upwards
- The boards must be exactly laid with seamless joints
- Maximum rafter spacing with 40 mm: 90 cm, with 60 mm: 100 cm, with 80 mm: 110 cm
- The boards are connected with an offset of > 30 cm
- Counter-batten fastening depends on the loads
- Fasten the insulation and vapour barrier immediately after laying
- Avoid excessive moisture caused by condensation
- Nail sealing tape is not required
- Suitable adhesive tapes (e. g. Ampack Ampacoll XT, pro clima® Tescon Vana und Siga Wigluv®) must always be used along with their respective primer.
Please observe the respective manufacturer's instructions

AREAS OF APPLICATION

- Sarking board in compliance with ZVDH regulations for regular roof pitches $\geq 16^\circ$: UDP-A (in accordance with regular roof pitches)
- Second water-repellent layer in various constructions
- Over-rafter insulating board in new constructions and for the renovation of inadequately insulated roofs
- Timber frame wall sheathing with rearventilated exterior cladding in accordance with DIN 68800-2
- F 90-B (REI 90) constructions in AGEPAN® SYSTEM
- Areas of application in compliance with DIN 4108-10 table 13: DAD-ds / WH

AGEPAN® THD T+G – ISOLERINGSEKSPERTEN

Kort generel monteringsvejledning

OPBEVARING OG TRANSPORT

- Pladerne skal opbevares vandret og godt understøttet
- Afstanden mellem understøtningerne må ikke overstige 60 cm
- Alle kanter skal beskyttes mod beskadigelse
- Individuelle plader skal transporteres i opretstående stilling, hvis dette er muligt
- Ved udpakning skal den samlede pladetykkelse måles
- Pladerne skal beskyttes mod direkte fugtpåvirkning under opbevaring

UDENDØRS EKSPONERING

- Ved brug til undertage er udendørs opbevaring kun muligt i op til otte uger
- Fugtabsorbering nedsætter pladernes styrke og denne vil ikke kunne blive genoprettet til fulde, selv efter de er tørret
- Midlertidig afdækning af pladerne kan være nyttigt, især hvis der senere skal udføres yderligere arbejde
- Hvis pladerne har absorberet fugt, skal det sikres at de tørres til det påkrævede fugtniveau, før anvendelse
- Husk at tage højde for mulige ændringer af pladelængder i forhold til konstruktionen.
- Lodret liggende lægter skal fastgøres ved alle samlinger, og både forsegling og afdækning skal være vind- og vandtætte
- Dræning af overfladevand kan forårsage misfarvning af metaloverflader. Brug derfor passende beskyttelsesfolie, og fjern først dette, når taget er blevet fuldstændigt dækket med plader

AKKLIMATISERING

- Som udgangspunkt er det nødvendigt at akklimatisere pladerne til det forventede påkrævede fugtniveau. Til dette formål skal emballagefolien fjernes under opbevaring på monteringsstedet
- Om nødvendigt skal der tages højde for eventuelle ændringer af pladernes længde ift. konstruktionen

BORTSKAFFELSE

- Bortskaffelse kan ske til almindelige genbrugsstationer. Pladerne kan afleveres som brændbart materiale
- Klassificeret i henhold til affaldskode 030105, 150103 og 170201 (i Det Europæiske Affaldskatalog) i overensstemmelse med bilag 3 i den tyske forordning om træaffald

FUNKTIONSHOLZ®

Please be sure to observe the current AGEPAN® SYSTEM processing instructions.
